

Summary of Findings

Table 2. Summary of Findings – Comparison of various thromboprophylaxis with outcomes ischemic stroke, thrombotic complications (including pulmonary embolism), hemorrhage (including intracranial), mortality, quality of life (QOL), and adverse effects (including pain post injection)

Population: Children with an indication for post-device closures (ASD/VSD)

Intervention: Thromboprophylaxis A

Comparator: Thromboprophylaxis B

Outcome	Study results and measurements	Absolute effect estimates		Certainty of the Evidence (Quality of evidence)	Summary
		Thromboprophylaxis A	Thromboprophylaxis B		
Ischemic stroke (critical) Thrombotic complications (including pulmonary embolism) (critical) Hemorrhage (including intracranial) (important) Mortality (important) Quality of life (QOL) (important) Adverse effects (including pain post injection) (important)	-	-	-	No GRADE (No evidence was found)	No evidence was found regarding the effect of thromboprophylaxis on ischemic stroke, thrombotic complications (including pulmonary embolism), hemorrhage (including intracranial), mortality, quality of life (QOL), and adverse effects (including pain post injection) when compared with other thromboprophylaxis in children with an indication for post-device closures (ASD/VSD)
